

Challenge: **Providers** receive priority access to innovative tools within organization, but siloed initiatives lead to fragmentation, longer days, and inefficiency rather than intended advancements in patient care or Provider experience.

Mobile technology holds the potential to knit fragmented systems together by connecting toolsets, bringing actionable insights to Provider's fingertips, & enabling documentation and communication from anywhere. These examples showcase opportunities for Providers to strengthen their mobile capabilities and deepen the partnership between clinical and technical innovation across the enterprise.

CURRENT

Bedside charting tools are accessed in the EMR when workstations are available. Comprehensive charting must **wait until the end of the day**.

Challenge 1:
Efficient
documentation
completion

FUTURE

Documentation can be completed through mobile Apps **when and where the Provider chooses**, including orders and narrative summaries.

Messages from patients and members of immediate and extended care teams arrive all day. There is **limited time** to find a workstation to **review & respond**.

Challenge 2:
Improve
response time

Messages can be accessed via Apps **improving response time, efficiency, and satisfaction** within care teams and patients.

CURRENT

The organization has implemented innovative diagnostic and analytics capabilities to improve patient outcomes. These tools are installed at workstations that **may not be convenient to Providers when incidents occur.**

FUTURE

Diagnostic and analytics tools are available on mobile Apps, offering Providers **immediate access to insights** that help guide the first steps of a patient's care following an incident.
